

UN-STOPPABLES

Child Nutrition and Survival: UN SDG 2 (Zero Hunger) and SDG 3 (Good Health & Well-being)

Presenters:

Joseph (w2113829)
Abdullah (w1779981)
Nauman(w2125954)

Why SDG 2 and SDG 3?

The Nutrition & Survival Connection

SDG 2: ZERO HUNGER

Addresses nutrition, stunting, and food security.

SDG 3: GOOD HEALTH

includes reducing child mortality (3.2.1)

NEARLY HALF OF
UNDER-FIVE DEATHS
GLOBALLY ARE LINKED
TO UNDERNUTRITION

Regions

2 ZERO HUNGER

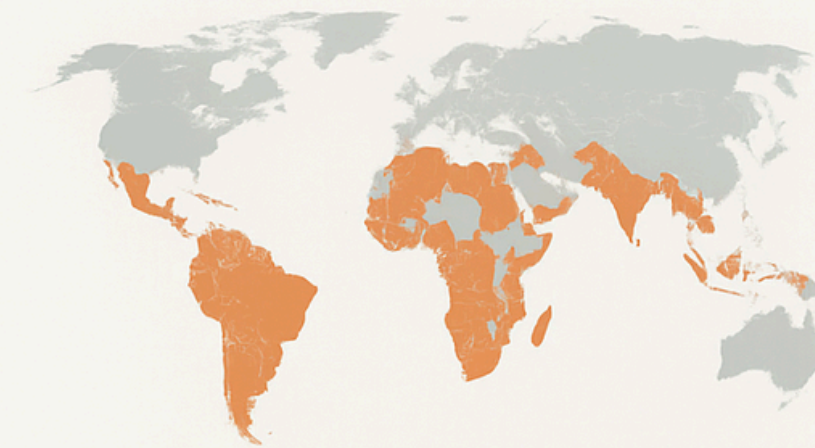

2.2.1 (Stunting)
2.2.2 (Wasting)

3 GOOD HEALTH AND WELL-BEING

3.2.1 (Under-5
Mortality Rate)

Stunting Drives Higher Under-5 Mortality Across Regions

Clustered bar chart (Avg. stunted, wasting, mortality by region)

Chronic undernutrition is the strongest predictor of child mortality in developing regions.

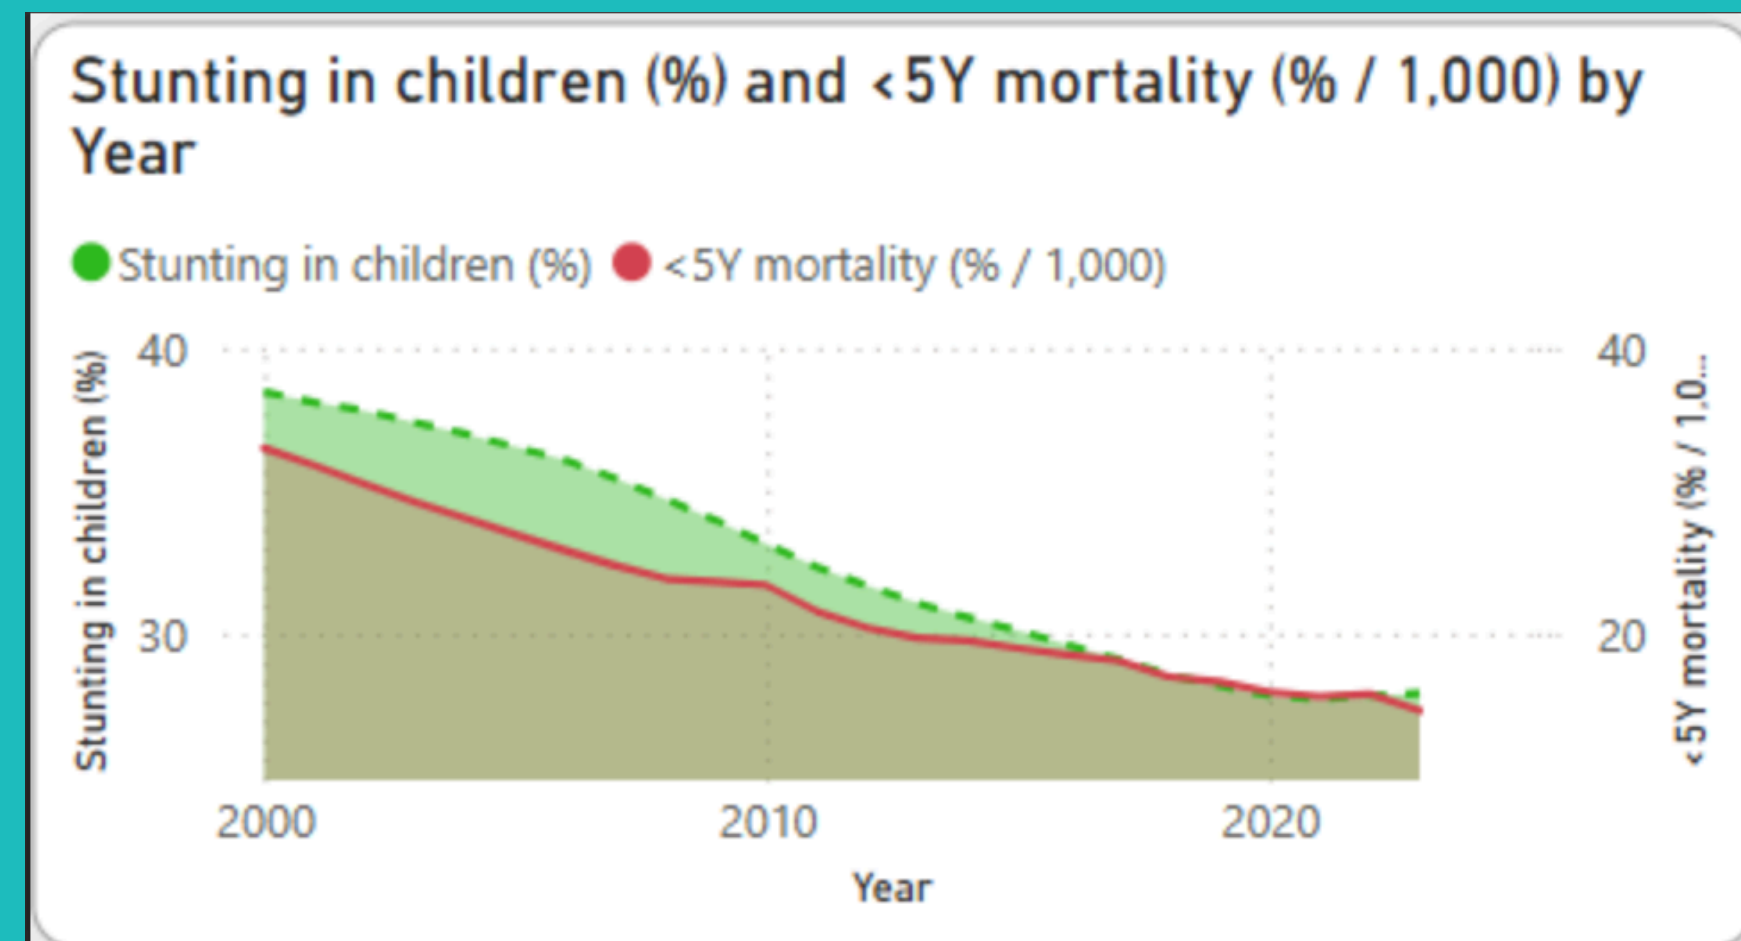

The comparison chart shows that countries with the highest rates of chronic undernutrition (stunting) also have the highest under-5 mortality.

In the Least Developed Countries, nearly 40% of children are stunted, and child deaths are the highest.

Landlocked countries follow, constrained by poor food access and healthcare logistics.

Small island states have lower malnutrition but still face mortality challenges due to healthcare isolation.

Stunting and Under-5 Mortality Decline Together Over Time (2000–2023)

Dual-axis line chart

“Early health gains outpaced nutrition progress — both are now slowing, risking SDG 2030 targets.”

This line chart shows that both stunting and child mortality have declined steadily over the last two decades. However, while mortality fell rapidly in the early 2000s due to public health programs, nutrition progress has been slower and more uneven.

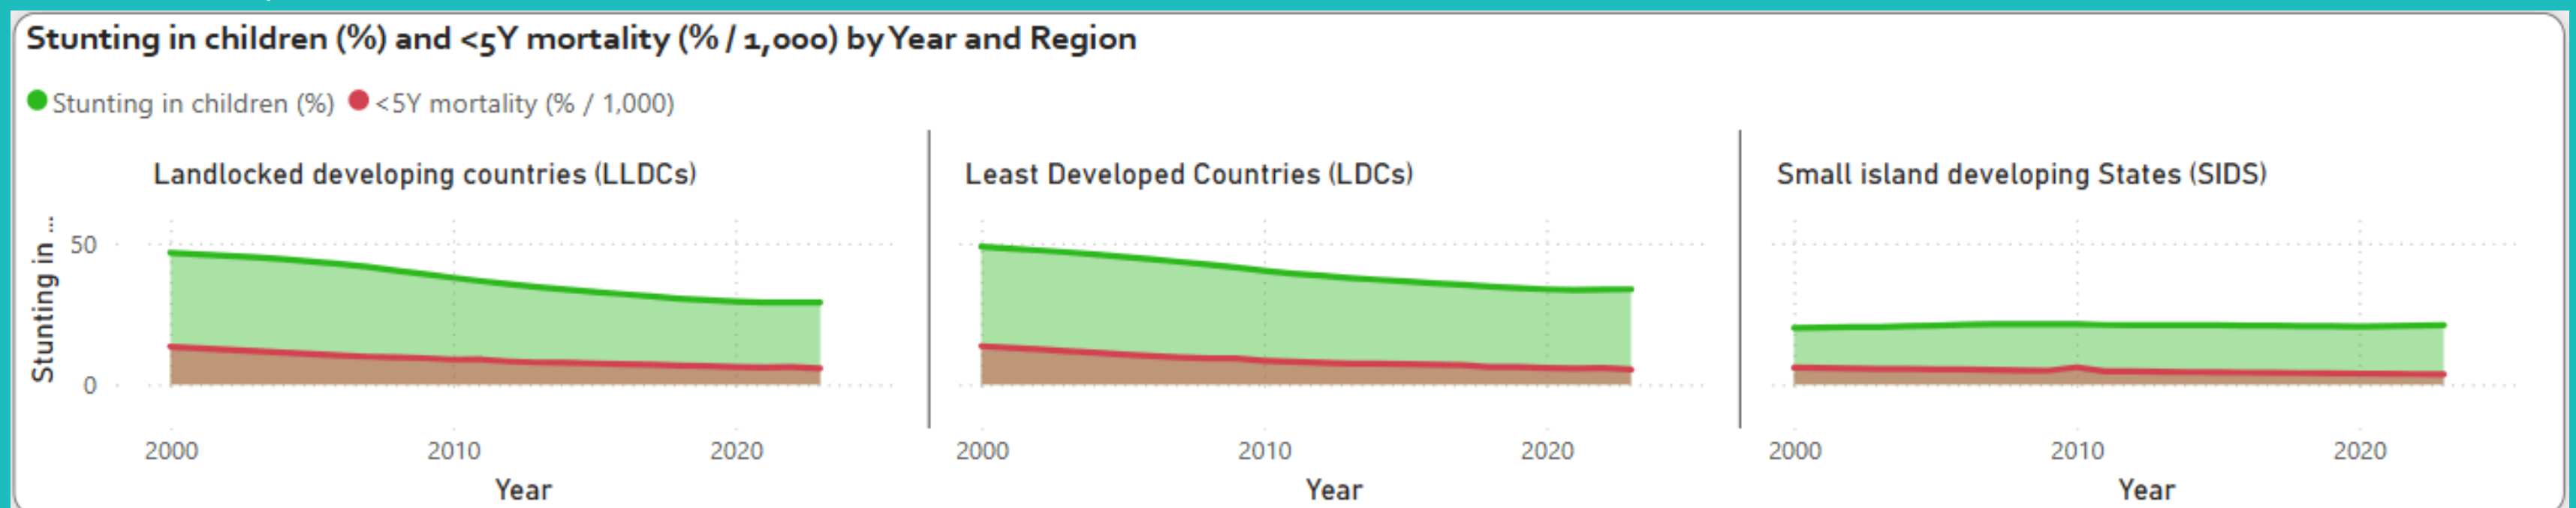

Since around 2018, both curves flatten, reflecting global disruptions like the pandemic and rising food insecurity.

Regional Progress: Parallel Gains, but Uneven Pace

This visual breaks down the trend by region. LDCs and LLDCs show consistent declines in both stunting and child mortality, which is a sign of progress. But Small Island States show stagnation, meaning nutrition levels are better, yet health outcomes haven't improved as much. This highlights the weak healthcare systems and emergency access issues these regions face.

“Nutrition gains translate into survival improvements, but only where health systems can sustain them.”

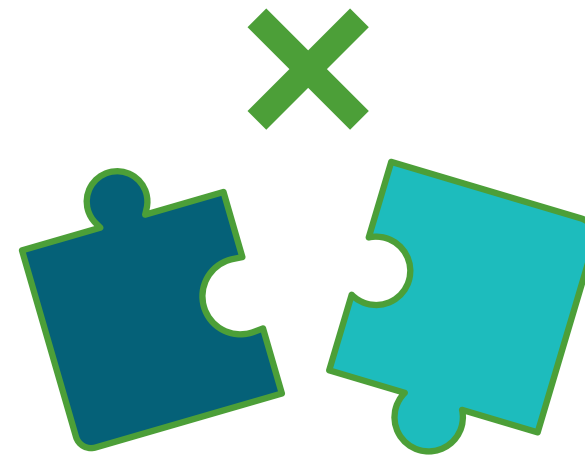

Small multiples (LDC, LLDC, SIDS)

Connecting Nutrition, Mortality, and Geography

UNDERNUTRITION → WEAKER
IMMUNITY → HIGHER CHILD
MORTALITY

LANDLOCKED STATES FACE
COMPOUNDED CHALLENGES

TRADE ACCESS = FOOD DIVERSITY =

MORTALITY

UN-STOPPABLES

Final Reflection – Feeding Health to Save Lives

- Nutrition and survival are inseparable.
- Every reduction in stunting and wasting moves us closer to ending preventable child deaths.
- Investing in better food systems, healthcare, and logistics will allow the most vulnerable countries to thrive.

THANK YOU
